

FanParty

Authors: Gabriel Ferreira Oliveira and Kaio Vinícius Cordeiro Batista

Product Vision

For business owners, event organizers and regular users who want to contact other users with the same interests or promote events that are their responsibility, FanParty is a web-based system focused on promoting events and holding community meetings, aiming to increase their reach and popularity, as well as attract potential sponsors and encourage social interaction in favor of similar causes and interests. Unlike regular event promotion software and social networks, our product is formed by the union of both, extracting the best of both, in which users, in addition to interacting with each other, can evaluate the events and meetings they have attended and close business partnerships.

Architecture

Our project is using a layered architecture based on the MVC pattern, with the addition of Service and Repository layers to make the code cleaner, modular and scalable.
